备注 Comment	The pMID21 is derived from pCES119 where the Fab-display cassette has been replaced with a cassette nearly identical to that of DY3F63. The iii(stump) of pMID21 is flanked by two MluI sites. MluI digestion and religation removes iii(stump), allowing the expression of soluble Fab fragments in E. coli.

复溶方法

1. Centrifuge at 5,000×g for 5 min.
2. Carefully open the tube and add sterile water to dissolve the DNA: add 20 µl for 5 µg plasmid, and 100 µl for 100 µg plasmid.
3. Close the tube and incubate for 10 minutes at room temperature.
4. Briefly vortex the tube and then do a quick spin to concentrate the liquid at the bottom. Speed is less than 5000×g.
5. Store the plasmid at -20 ℃.
