备注 Comment	pCXSN-HA is a plant binary overexpression vector from the ZeBaTA zero-background TA cloning system. An enhanced CaMV 35S promoter drives an N-terminal HA-tagged fusion, with the HA coding sequence located on the complementary strand at complement. A ccdB cassette enables direct TA cloning; Kan selects in E. coli and hygromycin in planta. Propagation requires the gyrA462 strain DB3.1.

复溶方法

1. Centrifuge at 5,000×g for 5 min.
2. Carefully open the tube and add sterile water to dissolve the DNA: add 20 µl for 5 µg plasmid, and 100 µl for 100 µg plasmid.
3. Close the tube and incubate for 10 minutes at room temperature.
4. Briefly vortex the tube and then do a quick spin to concentrate the liquid at the bottom. Speed is less than 5000×g.
5. Store the plasmid at -20 ℃.
